Timing Group Names

N	Parameter	Unit	Symbol	Figure	Definition
1.	Rise transition time rise_transition	ns	t _R	$\begin{array}{c} 0.9V_{DD} \\ \hline V_{SS} \\ \hline \end{array}$	The time it takes a driving pin to make a transition from kV _{DD} to (1-k)V _{DD} value. Usually k=0.1 (also possible k=0.2, 0.3, etc)
2.	Fall transition time fall_transition	ns	t _F	0.9V _{DD} 0.9V _{DD} V _{SS}	The time it takes a driving pin to make a transition from (1-k)V _{DD} to kV _{DD} value. Usually k=0.1 (also possible k=0.2, 0.3, etc)
3.	Propagation delay low-to-high (rise) cell_rise	ns	t _{PLH} (t _{PR})	0.5V _{DD} OUT	Time difference between the input signal crossing a 0.5V _{DD} and the output signal crossing its 0.5V _{DD} when the output signal is changing from low to high
4.	Propagation delay high-to-low (Fall) cell_fall	ns	t _{PHL} (t _{PF})	OUT 0.5V _{DD} 0.5V _{DD}	Time difference between the input signal crossing a $0.5V_{DD}$ and the output signal crossing its $0.5V_{DD}$ when the output signal is changing from high to low

Timing Constraints: Timing Types

Setup/Hold, Recovery/Removal Constraints

N	Parameter	Unit	Symbol	Figure	Definition
1	Setup time (only for flip-flops or latches) setup_rising setup_falling	ns	t _{su}	0.5V _{DD} DATA CLOCK DATA	The minimum period in which the input data to a flip-flop or a latch must be stable before the active edge of the clock occurs
2	Hold time (only for flip-flops or latches) hold_rising hold_falling	ns	t _H	O.5VDD t _H	The minimum period in which the input data to a flip-flop or a latch must remain stable after the active edge of the clock has occurred
3	Removal time (only for asynchronous Set or Reset) removal_rising, removal_falling	ns	t _{REM}	SET (RESE <u>T)</u> 0.5V _{DD} 0.5V _{DD} CLOCK t _{REM}	The minimum time in which the asynchronous Set or Reset pin to a flip-flop or latch must remain enabled after the active edge of the clock has occurred
4	Recovery time (only for asynchronous Set or Reset) recovery_rising, recovery_falling	ns	t _{REC}	SET (RESET) CLOCK 0.5V DD 0.5VDD trec	The minimum time in which Set or Reset must be held stable after being deasserted before next active edge of the clock occurs
